The invention relates to human nucleic acids (AAI57798-AAI61369) and the encoded polypeptides (AAM38642-AAM42213) with nootropic, the encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polymucleotides are useful in gene therapy. A composition containing a polypeptide or polymucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral nervous system diseases, such as lazheimer's, Parkinson's disease, Huntington's disease, such as lazheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression, Activin/inhibin activity, chemotectic/chemokinetic activity, haemostatic and thrombolytic activity, chemotectic/chemokinetic activity, haemostatic and thrombolytic activity, arthritis and inflammation, leukaemias and C.N.S disorders.

Note: The sequence data for this patent did not form part of the printed
                                                            Human, nootropic, immunosuppressant, cytostatic, gene therapy, cancer, peripheral nervous system; neuropathy; central nervous system; CNS; Alzheimer's; Parkinson's disease; Hunkington's disease; haemostatic; amyotrophic lateral sclerosis; Shy-Drager Syndrome; chemotactic, chemotactic; thrombolytic, drug screening; arthritis; inflammation;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ä
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Wang
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           disorders

The invention relates to the isolation of genes AACS9507-C59556 encoding generate fusion proteins AAB3418-B34264) The genes can be used to generate fusion proteins by linking to the gene for the human immunoglobulin G Fc portion (AACS9489) For increasing the stability of the fusion protein as compared to the human protein only. The genes and proteins are useful for preventing, amaliorating or treating medical conditions, e.g. by protein or gene therapy. The genes are isolated from a range of human tissues disclosed in the specification. The nuclear acids, proteins, annibodies and (ani)agonists are useful in the diagnosis, treatment and prevention of: (a) cancer, e.g. breast and ovarian cancer, and other cancers of the adrenal gland, bone marrow, breast, gastrointestinal tract, liver, lung, or urogenital; construction of: (b) immune disorders e.g. Addison's Alsease, autoimmune hemolytic anaemia, autoimmune thyvoiditis, diabetes mellitus, Crohn's clisease, multiple sclerosis, rheumatoid arthritis and ulcerative collitis; (c) cardiovascular disorders such as myocardial ischaemias; (d) collitis; (e) neurological diseases e.g. cerebral anoxia and collitis; (c) epilepsy; and (f) infectious diseases such as viral, bacterial, fungal
                                                                                                                                                                                                                                                Novel human secreted proteins useful for diagnosis, prevention and treatment of disorders including neurological, cell proliferative, cardiovascular, autoimmune and inflammatory disorders and microbial
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ysCysAlaValGluMetMetHisMetAlaAlaProArgTyrAspMetAsp 104

The present invention describes methods of obtaining immunogenic proteins from Neisseria genomic sequences, AAA81453 to AAA82414
represent specifically claimed Neisseria meningitidis genomic DNA sequences, AAA81250 to AAA82653 represent Composerial DNA sequences and AAB25620 to AAB2652 represent Neisseria meningitidis DNA sequences; and AAA81254 to AA881452 sepresent Neisseria meningitidis DNA sequences; and AAA81254 to Solation of Neisseria meningitidis DNA sequences; and AAA8132 to AAA81452 represent Neisseria meningitidis DNA sequences; and antibodies sequences, which are all used in the exemplification of the present invention. The nucleic acid sequences, protein sequences, and antibodies against them. can be used as a medicament (or in the manufacture of a composition can be used as a medicament (or in the manufacture of a medicament) for treating, preventing or diagnosing infection due to Neisserial bacteria. For example, some of the identified proteins could be components of vaccines against meningococcus B; against all serotypes; and/or against all pathogenic Neissariae. Identification of sequences and/or against all pathogenic Neissariae. Identification of sequences of room the bacterium will also facilitate production of bloicgical probes, particularly organism-specific probes. Attempts to make efficacious Meningococcus B vaccines have failed mainly due to antigen tolerance. Multivalent vaccines have failed mainly que to antigen tolerance. Multivalent vaccines have also been tried but none have successfully expected or surface sequences may provide an opportunity to identify secreted or surface exposed proceins that may be presumed targets for the immune system and which are not antigenically variable or at least more conserved than
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Scarlato V;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Isolated nucleotide sequences of Neisseria meningitidis which can be used in the diagnosis and treatment of N. meningitidis infection and other Neisserial infections, for example, N.gonorrhoea -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence 72750 BP; 17518 A; 19945 C; 18810 G; 16477 T; 0 other;

sequences which overlap each other at the beginning and each sequences which overlap each other at the beginning and each deach sequence by 49980 bp of AAF21544 is repeated at the beginning of AAF21607, the last 49980 bp of AAF21567 are repeated at the beginning of AAF21607, the last 49980 bp of AAF21568 encode the beginning of AAF21607, and so on). AAF21545 to AAF21589 encode the Neisseria proteins given in AAB58550 to AAB58593, and AAF21589 encode the Neisseria proteins given in AAB58550 to AAB58593, and AAF21589 to AAF21606 represent PCR primers which are used in the exemplification of the present invention. The NMB genome and fragments from it have antibacterial activity, and can be used in vaccines and gene therapy. Neisserial activity, and can be used in vaccines which binds to the proteins can be used in compositions for treating or preventing infection due to Neisserial bacteria or as a diagnostic reagent for detecting the bacteria. Computers, computer memory, computers storage medium or computer databases can be used in a search to identify open reading frames (ORFs) or coding sequences within the NMB genome. The DNA sequences provide further opportunities to find antigenic or immunogenic proteins which are used.
   sequence was too long to go in a record on its own it was split into 8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 349980 BP; 83241 A; 85091 C; 95206 G; 86442 T; 0 other;

Proteins from Neisseria genomic sequences. AAAB1453 to AAAB2414

Proteins from Neisseria genomic sequences. AAAB1453 to AAAB2414

represent specifically claimed Neisseria meningitidis genomic DNA sequences; AAAB1260 to AAAB1261 to AAAB2565 represent DNA sequences and their corresponding proteins; AAAB1254 to AAAB1259 and AAAB1304 to AAAB1321 represent FCR primers used in the isolation of Neisseria meningitidis MenB polynucleotide On the present invention: The nucleic acid sequences, proteins sequences; and antibodies sequences, which are all used in the exemplification of the present invention. The nucleic acid sequences, proteins sequences, and antibodies against them, can be used in the manufacture of a composition can be used as a medicament (or in the manufacture of medicament) for treating, preventing or diagnosing infection due to medicament) for treating, preventing or diagnosing infection due to be components of vaccines against Meningococcus B; against all pathogenic Neissariae. Identification of sequences and/or against all pathogenic Neissariae. Identification of sequences and/or against all pathogenic Neissariae. Identification of sequences and/or against all pathogenic Neissariae. Identification of sequences may provide an opportunity to identify secreted or surface sequences may provide an opportunity to identify secreted or surface exposed proteins that may be presumed targets for the immune system and which are not antigenically variable or at least more conserved than

         The present invention relates to a Moraxella catarrhalis genomic library comprising of a combination of 41 nucleic acid molecules (see PAP20514-AAP20554). The library has a number of uses described in the specification e.g. is useful for aidentifying diagnostic and therapeutic compositions. M. catarrhalis (Branhamella catarrhalis) is a large acrobic, gram-negative diplococcus, normally found among the bacterial flora of human upper airways. M. catarrhalis is known to cause acute, localised infections such as ottitis media, sinusitis and bronchopulmonary infection and life-threatening, systemic diseases including endocarditis
                                                                                                                                                                                                                                                                                       other

cuids which are expressed in hindburd and Alphahan tubble (HMT) tissue or head and nerve cord (HNC) tissue. The invention also relates to the encoded proteins. The invention additionally encompasses expression constructs, recombinant viruses and recombinant colls comprising the nucleic acids of the invention, recombinant production of the proteins, anticompositions comparisons the proteins a method of identifying inhibitors of the proteins, and compositions commissing the inhibitors of administration to an animal. The nucleic acids, and the proteins they encode may be used in the prevention, treatment and diagnosis of diseases administration to an animal. The nucleic acids, and the proteins they encode may be used in the prevention, treatment and diagnosis of diseases consociated with flea infestations. For example, the nucleic acids may be used to produce an HMT or HNC protein according to standard recombinant by a produce of the protein and protein and protein and administrate the presence of cat flea or other homologous nucleic acids and quantitate the presence of cat flea or other homologous nucleic acids and quantitate the presence of cat flea or other homologous nucleic acids and quantitate the presence of cat flea or other homologous nucleic acids and quantitate the presence of cat flea or other homologous nucleic acids and function of the proteins and their role in metabolism. The HMT and HMT and their metabolism and activity. The antibodies, and in assays to identify modulators (agonists and antagonists of HMT and/or HNC protein expression and activity. The Antibodies may also be used to downrequlate protein antibodies and antagonists may also be used to downrequlate protein expression and activity. The Antibodies may also be used to sugarned the presence of flea polypeptides in samples (e.g., by enzyma linked immunosorbent assay (ELISA)). The present sequence represents a cat flea (manuesorbent assay) the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to novel cat flea (Ctenocephalides felis) nucleic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Flea Malpighian tubule and head and nerve cord tissue derived nucleic acids useful for the prevention, diagnosis and treatment of flea infestations
                                                                                                                                                                                                                                                                                                                                                                                                                                          Cat flea; head and nerve cord nucleic acid; HNC; flea infestation; vaccine; antiparasitic; therapeutic target; diagnosis; detection; ss.

This sequence represents a human prostate tumour specific gene, and can be used in the method of the invention. The method is for detecting prostate cancer comprises contacting a biological sample with an agent able to bind an immunogenic portion of a prostate protein (such as encoded by this sequence). An antibody which binds to an immunogenic portion of the prostate protein, and the method can be used to detect, monitor progression of, or treat prostate cancers. The artibody may also be conjugated to a therapeutic agent for use in therapy of prostat
                                                                                                                                                                                                                                                                                                                                                                                                                                                                              useful

On Feb 17, 2001 this sequence version replaced gi:6633905.
Sequence submitted by:
Sequence Submitted by:
Berkeley Drosophila Genome Project
Lawrence Berkeley Mational Laboratory, MS 64-121
Berkeley, CA 94720
This sequence was assembled using end sequences from a whole genome shortgun and from subclones of this BAC and its neighboring clones.
For further information about this sequence, including its location and relationship to other sequences, please visit our sequence archive Web site (http://www.fruitfly.org/sequence/) or send email to bdgp@fruitfly.berkeley.edu.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 1 (Chaises I to 17512)

Submitted (27-529-1999) Drosophila Genome Center, Lawrence Berkeley Laboratory, MS 64-121, Berkeley, CA 94720, USA on Dec 13, 1999 this sequence version replaced gi:644944.

For further information about this sequence, including its location and relationship to other sequences, please visit our sequence archive Web site (http://www.fruitfly.org/sequence/) or send email to bdgp@fruitfly.berkeley.edu. All contigs in this submission meet the following cutoffs: length >= 200 bases.

* NOTE: This is a "working draft' sequence It currently consists of 77 contigs. The true order of the pieces is not known and their order in this sequence record is
                                                                                             Celnker.S.E., Agbayani,A., Arcaina,T.T., Baxter,E., Blazej,R.G.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         23073
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Direct Submission

Submitted (02-Aug-1999) Drosophila Genome Center, Lawrence Berkeley, Bubmitted (02-Aug-1999) Drosophila Genome Center, Lawrence Berkeley, Ca 94720, USA

On Feb 15, 2000 this sequence version replaced gi:6466495.

For further information about this sequence, including its location and relationship to other sequences, please visit our sequence archive Web site (http://www.fruitfly.org/sequence/) or send email to baggefruitfly.berkeley.edu. All contigs in this submission meet the following cutoffs: length >= 200 bases.

* NOTE: This is a "working draft' sequence. It currently

* consists of 110 contigs. The true order of the pieces

* is not known and their order in this sequence record is

* arbitrary. Gaps between the contigs are represented as

* Tuns of N, but the exact sizes of the gaps are unknown.

* This record will be updated with the finished sequence

* as soon as it is available and the accession number will

* be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                    Eukaryota, Metazoa; Arthropoda; Tracheata; Hexapoda; Insecta; Perryota, Neoptera; Endopteryota, Diptera; Brachycera; Perryota, Neoptera; Endopteryota, Diptera; Brachycera; Muscomorpha; Ephydroidea; Drosophilidae; Drosophila.

The present invention describes isolated polypeptides, comprising an immunogenic portion of a prostate tumour protein (PTP). The polypeptides and polypurclectides encoding them have cytostatic activity and can be used in vaccines and in gene therapy. The polypeptides and polypurclectides encoding them, antigen presenting cells which express the polypeptides, antibodies against the polypeptides and vaccines comprising them can be used for inhibiting the development of prostate
                                                                                                                                                                                                  202 AGAGGAANATCAAGGGGAGCGGAGGCTGCANATTTGGTACCGCAGGTAGGGCCGCGCGCCC 143

                                                                                                                                                                                                                                                                                                                                                                                                                                                       This sequence represents a human prostate tumour specific gene, and can be used in the method of the invention. The method is for detecting prostate cancer comprises contacting a biological sample with an agent able to bind an immunogenic portion of a prostate protein (such as encoded by this sequence). An antibody which binds to an immunogenic portion of the prostate protein, and the method can be used to detect, monitor progression of, or treat prostate cancers. The antibody my also be conjugated to a therapeutic agent for use in therapy of prostate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      372

cancer in a patient. The polypeptides can be used to generate antibodies or anti-idiotypic antibodies for passive immuno therapy. A portion of the polynoclectides encoding the polypeptides can be used as a probe or to modulate the expression of the polypeptides. AAA06241 to AAA06691 and AAA82000 to AAY82020 represent sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                           440

The present invention describes polynuclectide sequences (I) which encode prostate-specific proteins (II). (I) and (II) have cytostatic activity, and can be used in vaccine production and gene therapy. (I). (II), anticodies to (II), fusion proteins comprising (II), and isolated control to the prepared using (I) or (II) are used treat cancer in a patient. (I) and the antibodies are also used in the detection of cancer in a patient. The cancer that is diagnosed or treated is particularly prostate cancer. (I) and (II) can be used in vaccines. The antibodies or (I) can be used for monitoring the progression of cancer in a patient. (I) and (II) can also be used to improve diagnostic and therapeutic methods for prostate cancer. They can indicate the level of metastasis can well as the prostate volume. AAH93357 to AAH93944 and AAM01115 to AAM01318 represent polynucleotide and amino acid sequences used in the exemplification of the present invention.
                                                                                                                                                   790
